ABSTRACT OF THE DISCLOSURE

10 An auxiliary support table is provided having a workpiece support surface and a pair of elongated arms sized to telescopically extend through spaced apart longitudinal channels formed in a table saw base. The elongated support arms are provided with a pair of pivot members on the distal ends thereof to secure the arms to the channels. The auxiliary support table is pivotal between an in use position and a stored position. In the in use position, the support table is generally parallel to the table saw top while in a stored position, the elongated arms telescope outward through the channels allowing the auxiliary support table to pivot downwardly to a generally perpendicular position relative to the table top.
